

# HOW TO DISINFECT SURFACES.

Protect yourself. Do it for your health and hygiene.

## STEP 1. Clean up any spills or soiling (Clean what you can see)

Apply product directly onto the surface via the bottle applicator or via an impregnated disposable wipe.

Remove soiling by wiping the surface in a circular motion from the outside in.

Turn the wipe to an unused section (or use a fresh one) for a final wipe. Place wipe in a bag and dispose of correctly

## STEP 2. Disinfect the surface (Kill what you can't see)

Apply product directly onto the surface generously. Ensure product makes good contact with all surfaces that need to be treated.

Leave for 10 minutes. Then wipe or rinse off any excess if necessary.

For surfaces that may come into contact with skin or children, (eg. toys, highchairs), rinse thoroughly with water after the 10 minutes.

### Handy Tips:

PH FORCE recommends using caution when atomising disinfectant. Aspiration of disinfectants can cause respiratory problems.

For cleaning spaces where hygiene is critical, use disposable wipes or paper.

Organic soil inhibits disinfection. Make sure the surface is thoroughly cleaned before carrying out full surface disinfection (no rinse.)

Not intended for use on medical devices or therapeutic goods.
